# Application, characteristics, technical data

## Application

Type DF 50 filters are intended to separate gas impurities such as dust, rust, and other solids in gas-carrying line at a defined point. They are mainly used in gas systems and in front of such devices whose function is impaired by contamination.

These filters can be used for gases according to DVGW worksheet G 260/G 262 and for neutral non-aggressive gases. (other gases on request)

## Characteristics

- Easily replaceable filter cartridge
- High separation efficiency thanks to optimized flow guidance (30 µm standard, 5 µm optional)

## Type of models / Options (see page 8)

- Black epoxy resin coating
- Biogas & coke oven gas version (maximum 0.1% H<sub>2</sub>S)
- Flange sets for screw-in threads Rp1", Rp1.5", Rp2"

<b>Ex protection</b>	The mechanical parts of the device do not have any potential ignition sources of their own and therefore do not fall within the scope of ATEX 95 (94/9/EC). Electrical components fitted to the device comply with the ATEX requirements.
<b>Preferred installation position</b>	

The installation position of the gas filters is freely selectable

Note: Observe the following documents in relation to installation, start-up, and maintenance:

- DVGW - work sheets G 491 and G 600
- Operating and Maintenance Instructions DF50

## Structure and function

The gas flows through the inlet flange into the filter housing. The dust particles entrained in the gas are retained by the filter element. The cleaned gas flows off through the outlet flange.

The filters mainly consist of the housing, the cover, and the filter cartridge. Taking off the cover for maintenance and replacement of the filter cartridge guarantees easy access. The filter cartridge is made of non-woven polypropylene fibers, is equipped with a metal support frame and is suitable for holding dust and other impurities with a size  $\geq 30 \mu\text{m}$  ( $\geq 5 \mu\text{m}$  optional).

If the dust holding capacity is exceeded or there is an excessive pressure difference, the filter loses its protective function. In this case, the filter element must be replaced.

## Design

If the flow rate read from the diagram is based on the operating pressure instead of the pressure at standard conditions ( $p=1.01325$  bar,  $t=15^{\circ}\text{C}$ ), the pressure drop read from the diagram must be multiplied by the following factor:

$(1 + \text{relative pressure in bar})$

Example:

With a filter of size Rp1½" and an operating natural gas flow of 80 Nm<sup>3</sup>/h, the pressure drop according to the diagram is  $\Delta p = 2$  mbar. If this 80 Nm<sup>3</sup>/h flow is at 2 bar, then the effective pressure drop must be calculated as follows:

$$\Delta p = 2 \text{ mbar}^*) \times [(1 + 2) \times 1/\text{bar}] = 6 \text{ mbar}$$

\*) Determined from the diagram

The filter must be selected taking into account the following points:

- Pressure drop of  $\Delta p \leq 10$  mbar
- Flow rates  $w \leq$  at 20 m/s

## THE MEDENUS PLUS

### 10 reasons for good business relations

1. Consultancy expertise and quality standards developed over decades
2. Broad and proven standard range of feedback controllers
3. Modern, fast and efficient production for series products and for individual orders
4. Customer-specific design of pressure regulators and vacuum regulators and special designs
5. Guaranteed deadline compliance with a delivery deadline guarantee
6. Fast response time in all matters
7. Sufficiently large parts storage for production and spare parts
8. Customer-specific theory & practice training courses
9. Modular design right across the entire product range to facilitate optimized handling of spare parts
10. 100% Made in Germany
